

An Ontology-Based Approach to Relax Traffic Regulation for Autonomous Vehicle Assistance

Philippe Morignot, Fawzi Nashashibi

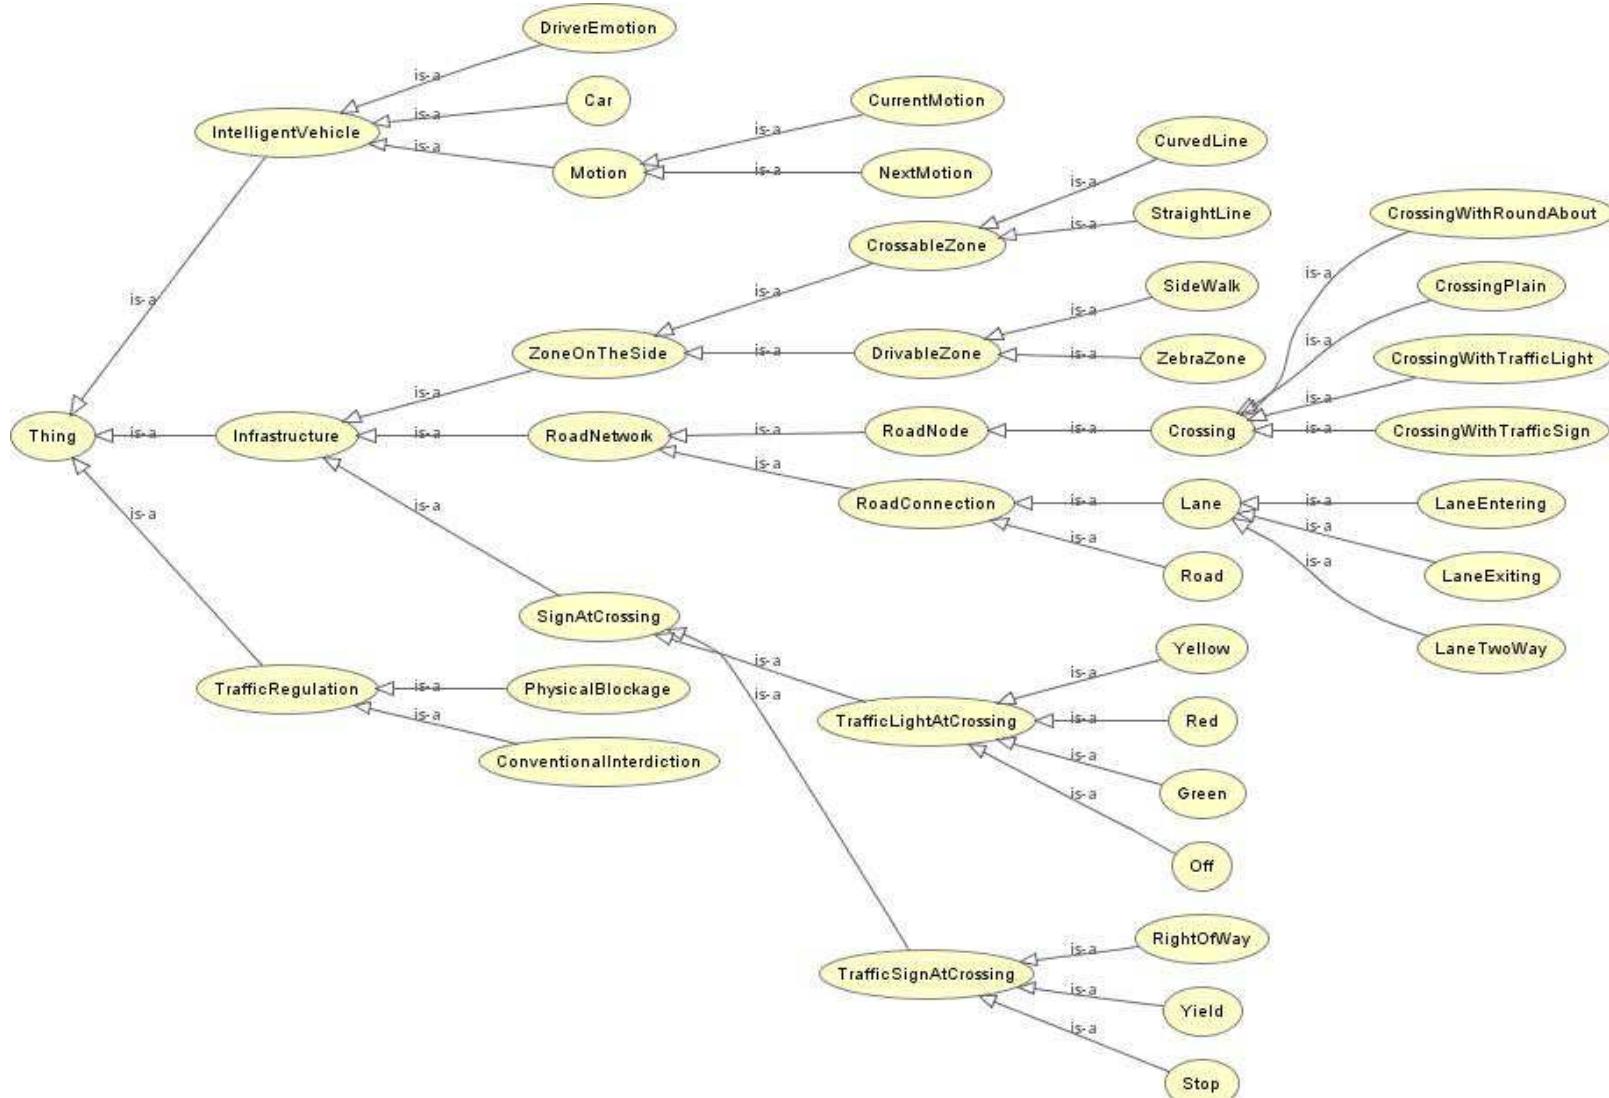

INRIA - Rocquencourt, France

Introduction

- « *Vehicles must circulate on roadways, except in case of absolute emergency* » (Vienna Convention on Road Traffic , 1968).
- Breaking traffic rules is forbidden, but tolerated in unusual situations, e.g., a truck unloading along a continuous line.

Ontology

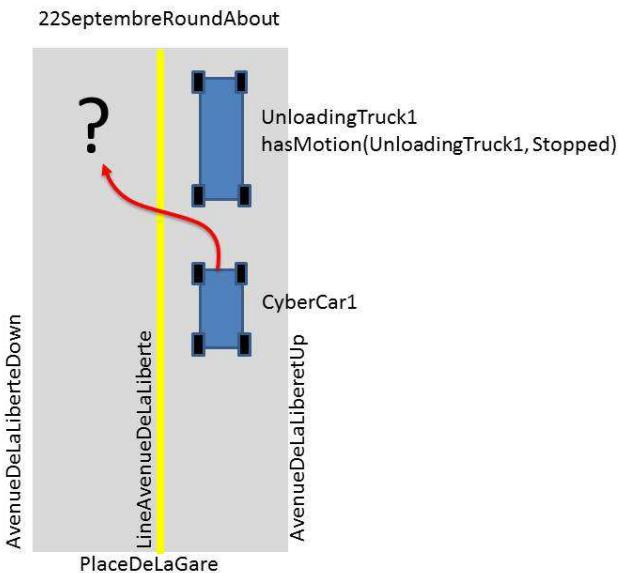

Inference rules

- Axioms (Tboxes) over situations (Aboxes), representing decision at time step n over $n+1$.
- Examples :
 - $\text{Car}(\textit{?a}), \text{Car}(\textit{?b}), \text{CrossableZone}(\textit{?s}), \text{Lane}(\textit{?l1}), \text{Lane}(\textit{?l2}), \text{hasState}(\textit{?a}, \text{Impatient}), \text{isAfter}(\textit{?a}, \textit{?b}), \text{hasBesides}(\textit{?l1}, \textit{?s}), \text{hasBesides}(\textit{?l2}, \textit{?s}), \text{hasMotion}(\textit{?a}, \text{Stopped}), \text{isOn}(\textit{?a}, \textit{?l1}), \text{isOn}(\textit{?b}, \textit{?l1}), \text{DifferentFrom}(\textit{?l1}, \textit{?l2}), \text{isIllegal}(\textit{?l1}, \textit{?l2}), \text{isClear}(\textit{?l2}) \rightarrow \text{isNextOn}(\textit{?a}, \textit{?l2})$
 - $\text{Car}(\textit{?a}), \text{Car}(\textit{?b}), \text{isBefore}(\textit{?a}, \textit{?b}), \text{hasMotion}(\textit{?a}, \text{Stopped}) \rightarrow \text{hasMotion}(\textit{?b}, \text{Stopped})$
 - $\text{Car}(\textit{?a}), \text{Car}(\textit{?b}), \text{isBefore}(\textit{?a}, \textit{?b}), \text{hasNextMotion}(\textit{?a}, \text{Forward}) \rightarrow \text{hasNextMotion}(\textit{?b}, \text{Forward})$

Implementation & results

- PROTEGE using DL reasoner PELLET (SWRL).
- Example of inferences:

With hasState(CyberCar1, Impatient) :

hasMotion(CyberCar1, Stopped)
isAfter(CyberCar1, UnloadingTruck1)
hasNextMotion(CyberCar1, Forward)
isNextOn(CyberCar1, AveLiberteDown)

With hasState(CyberCar1, Relax) :

hasMotion(CyberCar1, Stopped)
isAfter(CyberCar1, UnloadingTruck1)
hasNextMotion(CyberCar1, Stopped)

Conclusion

- Unusual / extreme situations in traffic.
- High level topological model of an automated car, other cars and the infrastructure.
- Ontology with inference rules in SWRL.
- Interesting performances.
- Future work:
 - Relating symbols to percepts.
 - Porting onto CyberCars.
